#### **Document Conventions**

The following conventions are used in this manual:

MUST	MUST denotes that the definition is and absolute re-
	quirement.
SHOULD	SHOULD denotes that it is recommended, but that
SHOULD	there may exist valid reasons to ignore it.
DEVICE	Device names are displayed in bold all upper case let-
DEVICE	ters, and refer to hardware devices.
	Text appearing in the Courier font represents either
	an OS System Variable a Z80 CPU Register or a Z80
~ '	Flag. OS System Variables are identifiers for spe-
Courier	cific MEMORY addresses that can be used to read
	statuses and to pass information between routines or
	programs.
	Numbers prefixed by 0x indicate an Hexadecimal
0x14B0	value. Unless specified, memory addresses are always
	expressed in Hexadecimal.
D 1 1 C	Text starting with F <sub>-</sub> refers to the name of an OS
$F_{-}abcdef$	routine that can be called via Jumpblocks.
jp abcdef	Refers to the Z80 mnemonic for <i>jump</i> , which transfers
	the CPU Program Counter to a specific <b>MEMORY</b>
	address.

The SD card is referred as **DISK**.

The Floppy Disk Drive is referred as **DISK** or as **FDD**.

The 80 column VGA output is referred as **CONSOLE**.

The Operating System may be referred as DZOS, dzOS or simply OS.

#### MEMORY refers to both ROM and RAM.

In the list of routines, the **Destroys** lists the **CPU** registers and **MEMORY** System Variables that are destroyed by the routine in question. But bare in mind that a routine may call other routines that may destroy other registers and variables. Refer to the **Calls** list to check the entire flow. By *Destroys* is understood that the listed register or variable value is overwritten within the routine.

	7.4	dzOS Programming Style	42

#### 1 Memory Map

#### 1.1 ROM

The **ROM** is a 16KB EEPROM, and is divided as follows:

Address		Description		Size (bytes)
0x0008	0x01E7	init SIO/2		480
0x01E8	0x133F	BIOS code	BIOS	4,448
0x1340	0x13BF	BIOS Jumpblock		128
0x13C0	0x267F	Kernel code		4,800
0x2670	0x267F	dzOS version build	Kernel	16
0x2680	0x277F	Kernel Jumpblock		256
0x2780	0x3D5F	CLI code	CLI	5,600
0x3B60	0x3E5F	Bootstrap	BOOTSTRAP	256
0x3E60	0x3FFF	Free		416

#### 1.2 RAM

The  $\mathbf{RAM}$  is a 64KB SRAM, and is divided as follows:

Address		Description	Size (bytes)
0x4000	0x401F	Stack	32
0x4020	0x4174	System Variables	341
0x4180	0x421F	Reserved for future use	160
0x4220	0x441F	DISK Buffer	512
0x4420	0xFFFF	Free RAM	48,096

#### 1.2.1 Stack

A Stack is a list of words (2 bytes) that uses Last In First Out (LIFO) access method. It is used by the **CPU** to keep track of **MEMORY** addresses when executing a call instruction.

The programmer can also store (PUSH) or retrieve (POP) values on/from the top of the stack.

Usage of the Stack requires very careful attention. doing (PUSH) without the corresponding (POP) or vice versa, will set the CPU on the wrong path of execution. Most of the time just hanging the computer, but also potentially destroying information if an access to disk is triggered by the wrong call.

#### 1.2.2 System Variables (SYSVARS)

The area of **RAM** called *System Variables* (*SYSVARS*) is an area heavily used by the OS, but it can also be used by a program to communicate with the OS.

The area has been *split* as follows:

#### • SIO

- 0x4020 SIO\_CH\_A\_BUFFER (64 bytes): Buffer for SIO Channel A.
- 0x4060 **SIO\_CH\_A\_IN\_PTR** (2 bytes)
- 0x4062 **SIO\_CH\_A\_RD\_PTR** (2 bytes)
- 0x4064 SIO\_CH\_A\_BUFFER\_USED (1 byte)
- 0x4065 SIO\_CH\_B\_BUFFER (64 bytes): Buffer for SIO Channel B.
- 0x40A5 **SIO\_CH\_B\_IN\_PTR** (2 bytes)
- 0x40A7 SIO\_CH\_B\_RD\_PTR (2 bytes)
- 0x40A9 SIO\_CH\_B\_BUFFER\_USED (1 byte)

#### • DISK Superblock

- 0x40AA DISK\_is\_formatted (1 byte): tells to the OS if the DISK can be used.
  - \* 0xFF = formatted with DZFS.
  - \*  $0 \times 00 = \text{not formatted}$ .
- 0x40AB **DISK\_show\_deleted** (1 byte)
  - \*  $0 \times 00 =$ do not show deleted files in *cat* command results.
  - \*  $0 \times 01 = \text{show also deleted files in } cat \text{ command results.}$
- 0x40AC DISK\_cur\_sector (2 bytes): current Sector being used by the OS.

#### • DISK BAT

- 0x40AE DISK\_cur\_file\_name (14 bytes): Filename of file currently being load or saved.
- 0x40BC DISK\_cur\_file\_attribs (1 byte): Attributes of file currently being load or saved.
  - \* Bit 0: if set, file is Read Only.

- \* Bit 1: if set, file is Hidden (it does not display in *cat* command results).
- \* Bit 2: if set, file is System (it does not display in *cat* command results).
- \* Bit 3: if set, file is Executable.
- \* Bits 4-7: not used.
- 0x40BD **DISK\_cur\_file\_time\_created** (2 bytes): time when currently being load or saved file was created.
- 0x40BE DISK\_cur\_file\_date\_created (2 bytes): date when currently being load or saved file was created.
- 0x40C1 DISK\_cur\_file\_time\_modified (2 bytes): time when currently being load or saved file was last modified.
- 0x40C3 DISK\_cur\_file\_date\_modified (2 bytes): date when currently being load or saved file was last modified.
- 0x40C5 DISK\_cur\_file\_size\_bytes (2 bytes): size in bytes of file currently being load or saved.
- 0x40C7 DISK\_cur\_file\_size\_sectors (1 byte): size in sectors of file currently being load or saved.
- 0x40C8 DISK\_cur\_file\_entry\_number (2 bytes): entry number in the BAT, of file currently being load or saved.
- 0x40CA DISK\_cur\_file\_1st\_sector (2 bytes): sector number, of the first sector, where the bytes of file currently being load or saved are stored in the DISK.
- 0x40CC DISK\_cur\_file\_load\_addr (2 bytes): address where the bytes of file currently being load will be stored in RAM.
- CLI: buffers used by CLI to store temporary data.
  - 0x40CE CLI\_buffer (6 bytes): generic buffer.
  - 0x40D4 CLI\_buffer\_cmd (16 bytes): when a user enters a command and its parameters, the command alone is stored here.
  - 0x40E4 **CLI\_buffer\_parm1\_val** (16 bytes): when a user enters a command and its parameters, the first parameter is stored here.
  - 0x40F4 CLI\_buffer\_parm2\_val (16 bytes): when a user enters a command and its parameters, the second parameter is stored here.
  - 0x40F4 **CLI\_buffer\_pgm** (32 bytes): generic buffer.

- 0x40F4 - CLI\_buffer\_full\_cmd (64 bytes): when a user enters a command and its parameters, the entire line entered by the user is stored here. This is useful for passing parameters to programs called with run command.

#### • RTC

- $0 \times 4164$  **RTC\_hour** (1 byte): 24h format, in hexadecimal  $(0 \times 00-0 \times 17)$ .
- -0x4165 **RTC\_minutes** (1 byte): in hexadecimal (0x00-0x3B).
- $-0x4166 RTC\_seconds$  (1 byte): in hexadecimal (0x00-0x3B).
- $0 \times 4167$  **RTC\_century** (1 byte): 20 part of year 20xx, in hexadecimal  $(0 \times 14 = 20)$ .
- 0x4168 RTC\_year (1 byte): xx part of year 20xx, in hexadecimal (e.g. 0x16 = 22). The RTC supports until 2079, therefore maximum value is 0x4F.
- 0x4169 RTC\_year4 (2 bytes): four digit year, in hexadecimal (e.g. 0x07E6 = 2022). The RTC supports until 2079, therefore maximum value is 0x081F.
- $-0x416B RTC_month (1 byte): in hexadecimal (0x00-0x0C).$
- $-0x416C RTC_day$  (1 byte): in hexadecimal (0x00-0x1F).
- 0x416D RTC\_day\_of\_the\_week (1 byte): 0x00=Sunday, 0x01=Monday, 0x02=Tuesday, 0x03=Wednesday, 0x04=Thursday, 0x05=Friday, 0x06=Saturday

#### • Math

- 0x416E MATH\_CRC (2 bytes): CRC-16 CRC.
- 0x4170 MATH\_polynomial (2 bytes): CRC-16 Polynomial.

#### • Generic

- 0x4172 SD\_images\_num (1 byte): number of Disk Image Files found by ASMDC.
- 0x4173 DISK\_current (1 byte): current DISK unit active.
   All disk operations will be on this DISK.
- $0x4174 DISK_status$  (1 byte): status of the FDD.
  - \* Low Nibble (0x00 if all OK)
    - · bit 0 = not used.
    - · bit 1 = not used.

- · bit 2 = set if last command resulted in error.
- · bit 3 = not used.
- \* High Nibble: error code of last operation.
- 0x4174 **DISK\_status** (1 byte): status of the **SD card**.
  - \* Low Nibble (0x00 if all OK)
    - · bit  $0 = \text{set if } \mathbf{SD}$  card was not found.
    - · bit 1 = set if Disk Image File was not found.
    - · bit 2 = set if last command resulted in error.
    - · bit 3 = not used.
  - \* High Nibble: number of Disk Image Files found.
- 0x4175 DISK\_file\_type (1 byte): File Type when creating (save) next file.
- 0x4176 DISK\_loadsave\_addr (2 bytes): see Read data from DISK and Write data to DISK.
- 0x4178 tmp\_addr1 (2 bytes): temporary storage for an address.
- 0x417A tmp\_addr2 (2 bytes): temporary storage for an address.
- 0x417C tmp\_addr3 (2 bytes): temporary storage for an address.
- 0x417E **tmp\_byte** (1 byte): temporary storage for a byte.
- 0x417F tmp\_byte2 (1 byte): temporary storage for a byte.

#### 1.2.3 DISK Buffer

Read and Write operations on **DISK** are done Sector by Sector (i.e 512 Bytes).

When loading a file, dzOS asks **ASMDC** for the first 512 bytes of the file, and stores it in this buffer. After the bytes are moved to **RAM**, dzOS asks **ASMDC** for the next 512 bytes, and so on until the file is read entirely.

When saving a file, dzOS copies the first 512 bytes of the file from **RAM** to this buffer. After sending the bytes to **ASMDC**, dzOS copies the next 512 bytes of the file, and so on until the file is saved entirely.

When doing a *cat* of a **DISK**, dzOS asks **ASMDC** for the first 512 bytes of the BAT, and stores it in this buffer. After the list of files is shown on the screen, dzOS asks **ASMDC** for the next 512 bytes, and so on until the entire catalogue has been shown.

## 2 I/O Map

ROM / RAM	0x38	ROM Paging
	0x80	Channel A Control
SIO	0x81	Channel A Data
510	0x82	Channel B Control
	0x83	Channel B Data

## 3 BIOS Jumpblocks

#### 3.1 General Routines

#### 3.1.1 F\_BIOS\_WBOOT

Action	Warm Boot. Executed after SIO/2 initialisation, or
	after a reset command
Entry	None
Exit	None
Destroys	None
Calls	jp F_KRN_START

#### 3.1.2 F\_BIOS\_SYSHALT

Action	Halts the computer. Executed after a halt command
Entry	None
Exit	Disables Interrupts (di)
Destroys	None
Calls	None

#### 3.2 Serial Routines

#### 3.2.1 F\_BIOS\_SERIAL\_INIT

Action	Initialises SIO/2: sets Channels A and B as 115,000	
	bps, 8N1, Interrupt in all characters	
	Configures the interrupt vector to 0x60	
	Sets the CPU to Interrupt Mode 2	
	Enables Interrupts	
Entry	None	
Exit	None	
Destroys	A, HL	
Calls	jp F_BIOS_WBOOT	

#### 3.2.2 F\_BIOS\_SERIAL\_CONIN\_A

Action	Reads a character from the SIO/2 Channel A	
Entry	None	
Exit	A = character read	
Destroys	A	
Calls	None	

#### ${\bf 3.2.3} \quad {\bf F\_BIOS\_SERIAL\_CONIN\_B}$

Action	Reads a character from the SIO/2 Channel B
Entry	None
Exit	A = character read
Destroys	A
Calls	None

#### 3.2.4 F\_BIOS\_SERIAL\_CONOUT\_A

Action	Sends a character to the SIO/2 Channel A
Entry	A = character to be send
Exit	None
Destroys	None
Calls	None

#### 3.2.5 F\_BIOS\_SERIAL\_CONOUT\_B

Action	Sends a character to the SIO/2 Channel B
Entry	A = character to be send
Exit	None
Destroys	None
Calls	None

#### 3.3 DISK Routines

#### ${\bf 3.3.1} \quad {\bf F\_BIOS\_SD\_BUSY\_WAIT}$

Action	Calls <b>ASMDC</b> to check if the <b>DISK</b> is busy, and
	loops until it is not busy.
Entry	None
Exit	None
Destroys	A
Calls	F_BIOS_SERIAL_CONOUT_B
	F_BIOS_SERIAL_CONIN_B

#### ${\bf 3.3.2} \quad {\bf F\_BIOS\_SD\_GET\_STATUS}$

Action	Calls <b>ASMDC</b> to check the status of the SD Card
	module.
Entry	None
Exit	$SD\_status$
	bit $0 = \text{set if SD card was not found}$
	bit $1 = \text{set}$ if image file was not found
	bit $2 = \text{set}$ if last command resulted in error
Destroys	A
Calls	F_BIOS_SD_BUSY
	F_BIOS_SERIAL_CONOUT_B
	F_BIOS_SERIAL_CONIN_B

#### 3.3.3 F\_BIOS\_SD\_PARK\_DISKS

Action	Tells <b>ASMDC</b> to close the Image File
Entry	None
Exit	None
Destroys	A
Calls	F_BIOS_SD_BUSY
	F_BIOS_SERIAL_CONOUT_B

#### 3.3.4 F\_BIOS\_SD\_MOUNT\_DISKS

Action	Tells <b>ASMDC</b> to open the Image File
Entry	None
Exit	None
Destroys	A
Calls	F_BIOS_SD_BUSY
	F_BIOS_SERIAL_CONOUT_B

#### ${\bf 3.3.5} \quad {\bf F\_BIOS\_DISK\_READ\_SEC}$

Reads a Sector (512 bytes), from the <b>DISK</b> and places
the bytes into the CF_BUFFER_START
E = sector address LBA 0 (bits 0-7)
D = sector address LBA 1 (bits 8-15)
C = sector address LBA 2 (bits 16-23)
B = sector address LBA 3 (bits 24-27)
BC are not used (set to zero), because max sector is
65,535
CF_BUFFER_START contains the 512 bytes read
A, B, HL, DISK_BUFFER_START
F_BIOS_SD_BUSY
F_BIOS_SERIAL_CONOUT_B
F_BIOS_SERIAL_CONIN_B

#### 3.3.6 F\_BIOS\_DISK\_WRITE\_SEC

Action	Writes a Sector (512 bytes), from the
	DISK_BUFFER_START into the <b>DISK</b>
Entry	E = sector address LBA 0 (bits 0-7)
	D = sector address LBA 1 (bits 8-15)
	C = sector address LBA 2 (bits 16-23)
	B = sector address LBA 3 (bits 24-27)
	BC are not used (set to zero), because max sector is
	65,535
Exit	DISK_BUFFER_START contains the 512 bytes written
Destroys	A, HL, DISK_BUFFER_START
Calls	F_BIOS_SD_BUSY
	F_BIOS_SERIAL_CONOUT_B
	F_BIOS_SERIAL_CONIN_B

#### ${\bf 3.3.7} \quad {\bf F\_BIOS\_FDD\_BUSY\_WAIT}$

Action	Calls <b>ASMDC</b> to check if the <b>FDD</b> is busy, and loops
	until it is not busy.
Entry	None
Exit	None
Destroys	A
Calls	F_BIOS_SERIAL_CONOUT_B
	F_BIOS_SERIAL_CONIN_B

#### 3.3.8 F\_BIOS\_FDD\_CHANGE

Action	Tells the <b>ASMDC</b> that the current <b>DISK</b> for opera-
	tions is now the <b>FDD</b> .
Entry	None
Exit	DISK_status is updated
Destroys	A
Calls	F_BIOS_SERIAL_CONOUT_B

#### ${\bf 3.3.9 \quad F\_BIOS\_FDD\_LOWLVL\_FORMAT}$

Action	Tells the <b>ASMDC</b> to low-level format a <b>DISK</b> in the
	FDD. This function does not set up any file system.
	It just fills with 0xF6 all bytes of all sectors.
Entry	None
Exit	$A = 0 \times 00$ if everything OK. Bit 2 set if command
	resulted in error.
Destroys	A
Calls	F_BIOS_SERIAL_CONOUT_B
	F_BIOS_SERIAL_CONIN_B

#### ${\bf 3.3.10 \quad F\_BIOS\_FDD\_MOTOR\_ON}$

Action	Tells the <b>ASMDC</b> to switch the <b>FDD</b> motor on. It
	is a recommended practice to switch the motor on and
	off manually if multiple sectors are to read or written.
Entry	None
Exit	None
Destroys	A
Calls	F_BIOS_SERIAL_CONOUT_B

#### ${\bf 3.3.11} \quad {\bf F\_BIOS\_FDD\_MOTOR\_OFF}$

Tells the <b>ASMDC</b> to switch the <b>FDD</b> motor off. It
is a recommended practice to switch the motor on and
off manually if multiple sectors are to read or written.
None
None
A
F_BIOS_SERIAL_CONOUT_B

#### ${\bf 3.3.12} \quad {\bf F\_BIOS\_FDD\_CHECK\_DISKIN}$

Action	Asks the <b>ASMDC</b> to check if a Floppy Disk is inside	
	the $\mathbf{FDD}$ .	
Entry	None	
Exit	A = 0x00  yes  / 0xFF  no	
Destroys	A	
Calls	F_BIOS_SERIAL_CONOUT_B	
	F_BIOS_SERIAL_CONIN_B	

#### 3.3.13 F\_BIOS\_FDD\_CHECK\_WPROTECT

Action	Asks the <b>ASMDC</b> to check if the Floppy Disk is write	
	protected.	
Entry	None	
Exit	A = 0x00  yes  / 0xFF  no	
Destroys	A	
Calls	F_BIOS_SERIAL_CONOUT_B	
	F_BIOS_SERIAL_CONIN_B	

#### 3.4 Real-Time Clock Routines

#### 3.4.1 F\_BIOS\_RTC\_GET\_TIME

Action	Gets the current time from the <b>ASMDC</b> , and stores
	hour, minutes and seconds as hexadecimal values in
	SYSVARS.
Entry	None
Exit	RTC_hour, RTC_minutes, RTC_seconds
Destroys	A
Calls	F_BIOS_SERIAL_CONOUT_B
	F_BIOS_SERIAL_CONIN_B

#### 3.4.2 F\_BIOS\_RTC\_GET\_DATE

Action	Gets the current date from the <b>ASMDC</b> , and stores day, month, year and day of the week as hexadecimal values in SYSVARS.		
Entry	None		
Exit	RTC_day,	RTC_month,	RTC_year,
	RTC_day_of_t	he_week	
Destroys	A, HL		
Calls	F_BIOS_SERIAL_CONOUT_B		
	F_BIOS_SERIA	AL_CONIN_B	

#### ${\bf 3.4.3} \quad {\bf F\_BIOS\_RTC\_SET\_TIME}$

Action	Tells <b>ASMDC</b> to store a new hour, minutes and
	seconds.
Entry	RTC_hour, RTC_minutes, RTC_seconds
Exit	None
Destroys	A
Calls	F_BIOS_SERIAL_CONOUT_B

#### 3.4.4 F\_BIOS\_RTC\_SET\_DATE

Action	Tells <b>ASMDC</b> to store a new day, month, year and		
	day of the week.		
Entry	RTC_day,	RTC_month,	RTC_year,
	RTC_day_of_the	_week	
Exit	None		
Destroys	A		
Calls	F_BIOS_SERIAL	.CONOUT_B	

#### 3.4.5 F\_BIOS\_CHECK\_BATTERY

Action	Asks the <b>ASMDC</b> if the battery is healthy or has to
	be replaced.
Entry	None
Exit	A = 0x0A  (Healthy) / 0x00  (Dead)
Destroys	A
Calls	F_BIOS_SERIAL_CONOUT_B
	F_BIOS_SERIAL_CONIN_B

#### 3.5 NVRAM Routines

#### 3.5.1 F\_BIOS\_NVRAM\_DETECT

Action	Asks the <b>ASMDC</b> if the NVRAM is present.
Entry	None
Exit	length (in bytes) of the NVRAM, or 0xff if not de-
	tected.
Destroys	A
Calls	F_BIOS_SERIAL_CONOUT_B
	F_BIOS_SERIAL_CONIN_B

## 4 Kernel Jumpblocks

## 4.1 General Routines

#### 4.1.1 F\_KRN\_SYSHALT

Action	Prepares the computer for a <i>HALT</i> .
Entry None.	
Exit	None
Destroys	A, HL
Calls	F_BIOS_SD_PARK_DISKS
	F_KRN_SERIAL_WRSTRCLR

#### 4.2 Serial Routines

#### 4.2.1 F\_KRN\_SERIAL\_SETFGCOLR

Action	Set the colour that will be used for the foreground
	(text).
	The colour will remain until a different one is set.
Entry	A = Colour number (as listed in Appendixes section)
Exit	None
Destroys	B, DE
Calls	F_BIOS_SERIAL_CONOUT_A
	$jp$ F_KRN_SERIAL_SEND_ANSI_CODE

#### 4.2.2 F\_KRN\_SERIAL\_WRSTR

Action	Outputs a string, terminated with Carriage Return to
	the CONSOLE.
Entry	$\mathtt{HL} = \mathrm{address} \; \mathrm{in} \; \mathbf{MEMORY} \; \mathrm{where} \; \mathrm{the} \; \mathrm{first} \; \mathrm{character}$
	of the string to be output is.
Exit	None
Destroys	A, HL
Calls	F_BIOS_SERIAL_CONOUT_A

#### 4.2.3 F\_KRN\_SERIAL\_WRSTRCLR

Action	Outputs a string, terminated with Carriage Return to
	the CONSOLE, with a specific foreground colour.
Entry	A = Colour number (as listed in Appendixes section)
	$\mathtt{HL} = \mathrm{address} \; \mathrm{in} \; \mathbf{MEMORY} \; \mathrm{where} \; \mathrm{the} \; \mathrm{first} \; \mathrm{character}$
	of the string to be output is.
Exit	None
Destroys	B, DE
Calls	F_KRN_SERIAL_SETFGCOLR
	jp F_KRN_SERIAL_WRSTR

#### ${\bf 4.2.4} \quad {\bf F\_KRN\_SERIAL\_WR6DIG\_NOLZEROS}$

Action	Outputs to the <b>CONSOLE</b> a string of ASCII characters representing a number, without outputing the leading zeros. (e.g. 30 30 31 32 30 34 is 001204, but the output wil be 1024)
Entry	IX = address in <b>MEMORY</b> where the ASCII char-
	acters are stored.
Exit	None
Destroys	A, B, DE, IX
Calls	F_BIOS_SERIAL_CONOUT_A

#### 4.2.5 F\_KRN\_SERIAL\_RDCHARECHO

Action	Reads with echo. Reads a character from the SIO/2
	Channel A, and outputs it to the <b>CONSOLE</b> .
Entry	None
Exit	A = read character.
Destroys	None
Calls	F_BIOS_SERIAL_CONIN_A
	F_BIOS_SERIAL_CONOUT_A

#### 4.2.6 F\_KRN\_SERIAL\_EMPTYLINES

Action	Outputs $n$ number of empty lines to the <b>CONSOLE</b> .
Entry	B = number  (n)  of empty lines to output.
Exit	None
Destroys	A
Calls	F_BIOS_SERIAL_CONOUT_A

#### 4.2.7 F\_KRN\_SERIAL\_PRN\_NIBBLE

Action	Outputs a single hexadecimal nibble in hexadecimal
	notation.
Entry	A = nibble to output. Nibble will be the less significant
	4 bits of the byte.
Exit	None
Destroys	A
Calls	F_BIOS_SERIAL_CONOUT_A

#### ${\bf 4.2.8} \quad {\bf F\_KRN\_SERIAL\_PRN\_BYTE}$

Action	Outputs a single hexadecimal byte in hexadecimal
	notation.
Entry	A = byte to output.
Exit	None
Destroys	A
Calls	F_BIOS_SERIAL_CONOUT_A

#### 4.2.9 F\_KRN\_SERIAL\_PRN\_BYTES

Action	Outputs $n$ number of bytes as ASCII characters.
Entry	B = number  (n)  of bytes to output.
	$\mathtt{HL} = \mathtt{address}$ in <b>MEMORY</b> where the first byte to
	output is.
Exit	None
Destroys	A, HL
Calls	F_BIOS_SERIAL_CONOUT_A

#### 4.2.10 F\_KRN\_SERIAL\_PRN\_WORD

Action	Outputs the 4 hexadecimal digits of a word in hexa-
	decimal notation.
Entry	HL = word to be output.
Exit	None
Destroys	A
Calls	F_KRN_SERIAL_PRN_BYTE

#### 4.2.11 F\_KRN\_SERIAL\_SEND\_ANSI\_CODE

Action	Writes an ANSI code to the SIO/2 Channel A.
Entry	DE = address in MEMORY where the first byte of
	ANSI escape code is.
	B = number of bytes in the ANSI escape code.
Exit	None
Destroys	A, DE
Calls	F_BIOS_SERIAL_CONOUT_A

#### 4.3 DZFS (file system) Routines

#### 4.3.1 F\_KRN\_DZFS\_READ\_SUPERBLOCK

Action	Reads 512 bytes from Sector 0 (corresponding to the
	DZFS Superblock) into the disk buffer in <b>MEMORY</b> .
	If the Superblock does not contain the correct DZFS
	signature, DISK_is_formatted is set to 0x00. Oth-
	erwise, is set to 0x01.
Entry	None
Exit	None
Destroys	A, DE, DISK_is_formatted
Calls	F_BIOS_SD_READ_SEC

#### 4.3.2 F\_KRN\_DZFS\_READ\_BAT\_SECTOR

Action	Reads a BAT Sector from <b>DISK</b> into <b>MEMORY</b> .
Entry	DISK_cur_sector holds the sector number for the
	BAT.
Exit	DISK Buffer contains the BAT sector.
Destroys	HL
Calls	F_KRN_DZFS_SEC_TO_BUFFER

#### 4.3.3 F\_KRN\_DZFS\_BATENTRY\_TO\_BUFFER

Action	Extracts the data of a BAT entry from the DISK
	Buffer in <b>MEMORY</b> and populates the values into
	System variables.
Entry	A = BAT entry number to extract data from.
Exit	DISK BAT System Variables are populated. See RAM
	Memory Map for for details.
Destroys	A, BC, DE, HL, IX, tmp_addr1
Calls	F_KRN_MULTIPLY816_SLOW

#### 4.3.4 F\_KRN\_DZFS\_SEC\_TO\_BUFFER

Action	Loads a Sector (512 bytes) from the <b>DISK</b> and copies		
	the bytes into the DISK Buffer in <b>MEMORY</b> .		
Entry	HL = Sector number to load.		
Exit	DISK Buffer contains the bytes of Sector loaded.		
Destroys	DE, HL		
Calls	F_BIOS_SD_READ_SEC		

#### ${\bf 4.3.5} \quad {\bf F\_KRN\_DZFS\_GET\_FILE\_BATENTRY}$

Action	Gets the BAT's entry number of a specified filename.			
Entry	HL = Address where the filename to check is stored			
Exit	BAT Entry values are stored in the SYSVARS.			
	DE = \$0000 if filename found. Otherwise, whatever			
	value had at start.			
Destroys	A, B, DE, HL, tmp_byte, tmp_addr2, tmp_addr3			
Calls	F_KRN_DZFS_SEC_TO_BUFFER			
	F_KRN_DZFS_BATENTRY_TO_BUFFER			
	F_KRN_STRLENMAX			
	F_KRN_STRCMP			

#### 4.3.6 F\_KRN\_DZFS\_LOAD\_FILE\_TO\_RAM

Action	Load a file from <b>DISK</b> . Copies the bytes stored in the <b>DISK</b> into <b>MEMORY</b> , at the specified <b>MEMORY</b>		
	address in the BAT.		
Entry	DE = 1st sector number in the DISK.		
	IX = file length in sectors.		
$\mathbf{Exit}$	None		
Destroys	BC, DE, HL, IX, tmp_addr1		
Calls	F_BIOS_SD_READ_SEC		

#### 4.3.7 F\_KRN\_DZFS\_DELETE\_FILE

Action	Marks a file as deleted. The mark is done by changing			
	the first character of the filename to $0x7E$ ( $$ )			
Entry	DE = BAT Entry number.			
Exit	None			
Destroys	A, DE, HL,			
Calls	F_KRN_MULTIPLY816_SLOW			
	F_KRN_DZFS_SECTOR_TO_SD			

#### 4.3.8 F\_KRN\_DZFS\_CHGATTR\_FILE

Action	Changes the attributes (RHSE) of a file.	
Entry	DE = BAT Entry number.	
	A = attributes mask byte.	
Exit	None	
Destroys	DE, HL,	
Calls	F_KRN_MULTIPLY816_SLOW	
	F_KRN_DZFS_SECTOR_TO_SD	

#### ${\bf 4.3.9} \quad {\bf F\_KRN\_DZFS\_RENAME\_FILE}$

Action	Changes the name of a file.		
Entry	IY = MEMORY address where the new filename is		
	stored.		
	DE = BAT Entry number.		
Exit	None		
Destroys	A, BC, DE, HL, IY		
Calls	F_KRN_MULTIPLY816_SLOW		
	F_KRN_DZFS_SECTOR_TO_SD		

#### ${\bf 4.3.10 \quad F\_KRN\_DZFS\_FORMAT\_DISK}$

Action	Formats a <b>DISK</b> with DZFS.
Entry	HL = MEMORY address where the disk label is
	stored.
Exit	None
Destroys	A, BC, DE, HL, IX, IY, tmp_addr1, tmp_byte
Calls	F_KRN_SERIAL_WRSTR
	F_KRN_DZFS_CALC_SN
	F_KRN_RTC_GET_DATE
	F_BIOS_RTC_GET_TIME
	F_KRN_BCD_TO_ASCII
	F_KRN_BIN_TO_BCD4
	F_KRN_BIN_TO_BCD6
	F_KRN_DZFS_SECTOR_TO_SD
	F_KRN_SETMEMRNG
	F_BIOS_SERIAL_CONOUT_A
	F_BIOS_SD_PARK_DISKS
	F_BIOS_SD_MOUNT_DISKS

#### 4.3.11 F\_KRN\_DZFS\_CALC\_SN

Action	Calculates the Serial Number (4 bytes) for a <b>DISK</b> .
Entry	IX = MEMORY address where the serial number
	will be stored.
Exit	None
Destroys	A, BC, DE, HL, IX
Calls	F_BIOS_RTC_GET_DATE
	F_BIOS_RTC_GET_TIME
	F_KRN_MULTIPLY816_SLOW

#### ${\bf 4.3.12} \quad {\bf F\_KRN\_DZFS\_SECTOR\_TO\_DISK}$

Action	Calls the <b>BIOS</b> subroutine that will store the data (512 bytes) currently in DISK Buffer in			
	MEMORY, to the DISK.			
$\mathbf{Entry}$	$DISK_cur_sector = the sector number in the DISK$			
	that will be written.			
Exit	None			
Destroys	BC, DE			
Calls	F_BIOS_SD_WRITE_SEC			

#### 4.3.13 F\_KRN\_DZFS\_GET\_BAT\_FREE\_ENTRY

Action	Get number of available BAT entry.		
Entry	None		
Exit	DISK_cur_file_entry_number = entry number.		
Destroys	Α,	IY,	CF_cur_sector,
	CF_cur_file_entry_number		
Calls	F_KRN_DZFS_READ_BAT_SECTOR		
	F_KRN_DZFS_BATENTRY_TO_BUFFER		

### ${\bf 4.3.14} \quad {\bf F\_KRN\_DZFS\_ADD\_BAT\_ENTRY}$

Adds a BAT entry into the <b>DISK</b> .		
DE = BAT entry number.		
DISK_cur_sector = Sector number where the BAT		
Entry is in the <b>DISK</b> .		
DISK_BUFFER_START = Sector (512 bytes) contain-		
ing the BAT where the entry is.		
DISK BAT = BAT Entry data that will be saved to		
DISK.		
None		
A, BC, DE, HL		
F_KRN_MULTIPLY816_SLOW		

#### ${\bf 4.3.15} \quad {\bf F\_KRN\_DZFS\_CREATE\_NEW\_FILE}$

	C + C1 / 1:4 1: DATE D + \
Action	Creates a new file (and its corresponding BAT Entry)
	in the <b>DISK</b> , from bytes stored in <b>MEMORY</b> .
${f Entry}$	$\mathtt{HL} = \mathbf{MEMORY}$ address of the first byte to be
	stored.
	BC = number of bytes to be stored in the DISK.
	IX = MEMORY address where the filename is
	stored.
Exit	None
Destroys	A, BC, DE, HL, IX, tmp_addr1, tmp_addr2,
	<pre>tmp_addr3, tmp_byte</pre>
Calls	F_KRN_DZFS_GET_BAT_FREE_ENTRY
	F_KRN_DIV1616
	F_KRN_MULTIPLY1616
	F_KRN_COPYMEM512
	F_KRN_CLEAR_MEMAREA
	F_KRN_CLEAR_DISKBUFFER
	F_KRN_DZFS_SECTOR_TO_SD
	F_BIOS_SD_BUSY_WAIT
	F_KRN_SERIAL_WRSTRCLR
	F_KRN_DZFS_CALC_FILETIME
	F_KRN_DZFS_CALC_FILEDATE
	F_KRN_DZFS_SEC_TO_BUFFER
	F_KRN_DZFS_ADD_BAT_ENTRY

#### 4.3.16 F\_KRN\_DZFS\_CALC\_FILETIME

Action	Packs current Real-Time Clock time into two bytes,
	which is the format used to store times (cre-
	ated/modified) for files in the <b>DISK</b> .
	The formula used is: $2048 * hours + 32 * minutes +$
	seconds/2
Entry	None
Exit	HL = RTC  time
Destroys	A, DE, HL
Calls	F_BIOS_RTC_GET_TIME

#### ${\bf 4.3.17} \quad {\bf F\_KRN\_DZFS\_CALC\_FILEDATE}$

Action	Packs current Real-Time Clock date into two bytes, which is the format used to store dates (created/modified) for files in the <b>DISK</b> .  The formula used is: $512 * (year - 2000) + month * 32 + day$
Entry	None
Exit	HL = RTC date
Destroys	A, DE, HL
Calls	F_BIOS_RTC_GET_DATE

#### ${\bf 4.3.18} \quad {\bf F\_KRN\_DZFS\_SHOW\_DISKINFO\_SHORT}$

Action	Outputs to the <b>CONSOLE</b> some information of the
	DISK: volume label, serial number, date/time cre-
	ation.
Entry	None
Exit	None
Destroys	A, BC, DE, HL
Calls	F_KRN_SERIAL_WRSTRCLR
	F_KRN_SERIAL_PRN_BYTE
	F_KRN_SERIAL_PRN_BYTES
	F_BIOS_SERIAL_CONOUT_A
	F_KRN_SERIAL_EMPTYLINES

#### 4.3.19 F\_KRN\_DZFS\_SHOW\_DISKINFO

Action	Outputs to the <b>CONSOLE</b> all information of the
	DISK: volume label, serial number, date/time cre-
	ation, file system ID, number of partitions, number of
	bytes per sector, number of sectors per block.
Entry	None
Exit	None
Destroys	A, BC, DE, HL, tmp_addr1
Calls	F_KRN_DZFS_SHOW_DISKINFO_SHORT
	F_KRN_SERIAL_WRSTRCLR
	F_KRN_SERIAL_PRN_BYTE
	F_KRN_SERIAL_PRN_BYTES
	F_BIOS_SERIAL_CONOUT_A
	F_KRN_SERIAL_EMPTYLINES

#### ${\bf 4.3.20 \quad F\_KRN\_DZFS\_CHECK\_FILE\_EXISTS}$

Action	Checks if a specified filename exsists in the <b>DISK</b> .
Entry	$\mathtt{HL} = \mathbf{MEMORY}$ address where the filename to check
	is stored.
Exit	Z Flag set if filename is not found.
Destroys	A, DE, tmp_addr3
Calls	F_KRN_DZFS_GET_FILE_BATENTRY

#### 4.4 Math Routines

#### $4.4.1 \quad F\_KRN\_MULTIPLY816\_SLOW$

Action	Multiplies an 8-bit number by a 16-bit number ( $HL =$
	A * DE).
	It does a slow multiplication by adding the multiplier
	to itself as many times as multiplicand (e.g. $8*4=$
	8+8+8+8).
Entry	A = Multiplicand
	DE = Multiplier
Exit	$\mathtt{HL} = \mathrm{Product}$
Destroys	B, HL
Calls	None

#### 4.4.2 F\_KRN\_MULTIPLY1616

Action	Multiplies two 16-bit numbers ( $HL = HL * DE$ )
Entry	HL = Multiplicand
	DE = Multiplier
Exit	HL = Product
Destroys	A, BC, DE, HL
Calls	None

#### 4.4.3 F\_KRN\_DIV1616

Action	Divides two 16-bit numbers (BC = BC / DE, $HL =$
	remainder)
Entry	BC = Dividend
	DE = Divisor
Exit	BC = Quotient
	HL = Remainder
Destroys	A, BC, HL
Calls	None

#### 4.4.4 F\_KRN\_CRC16\_INI

Action	Initialises the CRC to 0 and the polynomial to
	the appropriate bit pattern, to generate a CRC-
	$16/BUYPASS1^{1}$ .
Entry	None
Exit	MATH_CRC = 0 (initial CRC value)
	${\tt MATH\_polynomial} = {\tt CRC} \ polynomial$
Destroys	HL
Calls	None

#### 4.4.5 F\_KRN\_CRC16\_GEN

Action	Combines the previous CRC with the CRC generated from the current data byte, to generate a CRC-16/BUYPASS1 <sup>2</sup> .
Entry	A = current data byte.
	$MATH\_CRC = previous CRC$
	$ exttt{MATH\_polynomial} = \operatorname{CRC} \operatorname{polynomial}$
Exit	MATH_CRC = CRC with current data byte included
Destroys	A, BC, DE, HL
Calls	None

## 4.5 String manipulation Routines

#### 4.5.1 F\_KRN\_IS\_PRINTABLE

Action	Checks if a character is a printable ASCII character.
Entry	A = character to check.
Exit	C Flag is set if character is printable.
Destroys	None
Calls	None

#### 4.5.2 F\_KRN\_IS\_NUMERIC

Action	Checks if a character is numeric $(0, 1, 2, 3, 4, 5, 6, 7,$
	8 or 9).
Entry	A = character to check.
Exit	C Flag is set if character is numeric.
Destroys	None
Calls	None

#### 4.5.3 F\_KRN\_TOUPPER

Action	Converts a charcater to uppercase (e.g. $a$ is converted
	to A).
Entry	A = character to convert.
Exit	A = uppercased character.
Destroys	None
Calls	None

#### 4.5.4 F\_KRN\_STRCMP

Action	Compares two strings.
Entry	A = length of string 1.
	$\mathtt{HL} = \mathbf{MEMORY}$ address where the first byte of
	string 1 is located.
	B = length of string  2.
	DE = <b>MEMORY</b> address where the first byte of
	string 2 is located.
Exit	if $str1 = str 2$ , Z Flag set and C Flag not set.
	if str1 != str 2 and str1 longer than str2, Z Flag not
	set and C Flag not set.
	if str1 != str 2 and str1 shorter than str2, Z Flag not
	set and C Flag set.
Destroys	A, BC, DE,HL
Calls	None

#### 4.5.5 F\_KRN\_STRCPY

Action	Copies $n$ characters from string 1 to string 2.
Entry	HL = MEMORY address where the first byte of
	string 1 is located.
	DE = MEMORY address where the first byte of
	string 2 is located.
	B = number of characters to copy.
Exit	None
Destroys	A, DE, HL
Calls	None

#### 4.5.6 F\_KRN\_STRLEN

Action	Gets the length of a string that is terminated with a
	specified character.
Entry	$\mathtt{HL} = \mathbf{MEMORY}$ address where the first byte of the
	string is located.
	A = terminating character.
Exit	B = length of the string.
Destroys	BC, HL
Calls	None

#### 4.5.7 F\_KRN\_STRLENMAX

Action	Gets the length of a string that is terminated with a
	specified character, but only check up to a maximum
	of characters.
Entry	$\mathtt{HL} = \mathbf{MEMORY}$ address where the first byte of the
	string is located.
	A = terminating character.
	B = maximum length to be checked.
Exit	B = length of the string.
Destroys	BC, DE, HL
Calls	None

### 4.6 Conversion Routines

#### 4.6.1 F\_KRN\_ASCIIADR\_TO\_HEX

Action	Convert an address (or any 2 bytes) from hex ASCII to
	its hexadecimal value (e.g. 32 35 37 30 are converted
	into 2570).
Entry	IX = MEMORY address where the first byte is loc-
	ated.
Exit	HL = hexadecimal converted value.
Destroys	HL
Calls	F_KRN_ASCII_TO_HEX

#### 4.6.2 F\_KRN\_ASCII\_TO\_HEX

Action	Converts two ASCII characters (representing two
	hexadecimal digits); to one byte in hexadecimal (e.g.
	0x33 and $0x45$ are converted into $3E$ ).
Entry	H = Most significant ASCII digit.
	L = Less significant ASCII digit.
Exit	A = Converted value.
Destroys	A, BC
Calls	None

#### 4.6.3 F\_KRN\_HEX\_TO\_ASCII

Action	Converts one byte in hexadecimal to two ASCII print-
	able characters (e.g. 0x3E is converted into 33 and
	45, which are the ASCII values of 3 and E).
Entry	A = Byte to convert.
Exit	H = Most significant ASCII digit.
	L = Less significant ASCII digit.
Destroys	A, BC, HL
Calls	None

#### 4.6.4 F\_KRN\_BCD\_TO\_BIN

Action	Converts a byte of BCD to a byte of hexadecimal (e.g.
	12 is converted into 0x0C).
Entry	A = BCD.
Exit	A = Hexadecimal.
Destroys	A, BC
Calls	None

#### 4.6.5 F\_KRN\_BIN\_TO\_BCD4

Action	Converts a byte of unsigned integer hexadecimal to
	4-digit BCD (e.g. 0x80 is converted into 0128).
Entry	A = Unsigned integer to convert.
Exit	H = Hundreds digits.
	L = Tens digits.
Destroys	A, BC, HL
Calls	None

# $4.6.6 \quad F\_KRN\_BIN\_TO\_BCD6$

Action	Converts two bytes of unsigned integer hexadecimal to
	6-digit BCD (e.g. 0xffff is converted into 065535).
Entry	HL = Unsigned integer to convert.
Exit	C = Thousands digits.
	D = Hundreds digits.
	E = Tens digits.
Destroys	A, BC, DE, HL
Calls	None

## 4.6.7 F\_KRN\_BCD\_TO\_ASCII

Action	Converts 6-digit BCD to hexadecimal ASCII string
	(e.g. 512 is converted into 30 30 30 35 31 32).
Entry	DE = MEMORY address where the converted string
	will be stored.
	C = first two digits of the 6-digit BCD to convert.
	H = next two digits of the 6-digit BCD to convert.
	L = last two digits of the 6-digit BCD to convert.
Exit	None
Destroys	A, DE
Calls	None

# 4.6.8 F\_KRN\_BITEXTRACT

Action	Extracts a group of bits from a byte and returns the
	group in the LSB position.
Entry	E = byte from where to extract bits.
	D = number of bits to extract.
	A = start extraction at bit number.
Exit	A = extracted group of bits
Destroys	A, BC, DE, HL
Calls	None

# 4.6.9 F\_KRN\_BIN\_TO\_ASCII

Action	Converts a 16-bit signed binary number (-32768 to
	32767) to ASCII data (e.g. 32767 is converted into
	33 32 37 36 37).
Entry	D = High byte of value to convert.
	E = Low byte of value to convert.
Exit	CLI_buffer_pgm = converted ASCII data. First
	byte us the length.
Destroys	A, BC, DE, HL, CLI_buffer_pgm
Calls	None

# $\bf 4.6.10 \quad F\_KRN\_DEC\_TO\_BIN$

Action	Converts an ASCII string consisting of the length of the number (in bytes), a possible ASCII - or + sign, and a series of ASCII digits to two bytes of binary data. Note that the length is an ordinary binary number, not an ASCII number. (e.g. 33 32 37 36 37 is converted into 7FFF).
Entry	HL = MEMORY address where the string to be converted is.
Exit	HL = converted bytes.
Destroys	A, BC, DE, HL, tmp_byte
Calls	None

# 4.6.11 F\_KRN\_PKEDDATE\_TO\_DMY

Action	Extracts day, month and year from a packed date
	(used by DZFS to store dates).
Entry	HL = packed date.
Exit	A = day.
	B = month.
	C = year.
Destroys	A, BC, HL, tmp_addr1
Calls	None

## $4.6.12 \quad F\_KRN\_PKEDTIME\_TO\_HMS$

Action	Extracts hour, minutes and seconds from a packed
	time (used by DZFS to store times).
Entry	HL = packed time.
Exit	A = hour.
	B = minutes.
	C = seconds.
Destroys	A, BC, HL, tmp_addr1
Calls	None

# 4.7 MEMORY Routines

# 4.7.1 F\_KRN\_SETMEMRNG

Action	Sets (changes) a value in a MEMORY position
	range.
Entry	HL = MEMORY  start position (first byte).
	BC = number of bytes to set.
	A = value to set.
Exit	None
Destroys	BC, HL
Calls	None

# 4.7.2 F\_KRN\_COPYMEM512

Action	Copies bytes from one area of <b>MEMORY</b> to another, in group of 512 bytes (i.e. max. 512 bytes). If less than
	512 bytes are to be copied, the rest will be filled with
	zeros.
Entry	$\mathtt{HL} = \mathbf{MEMORY}$ origin position (from where to copy
	the bytes).
	DE = MEMORY destination position (to where to
	copy the bytes).
	BC = number of bytes to copy (MUST be less or equal
	to 512).
Exit	None
Destroys	A, BC, DE, HL
Calls	None

# 4.7.3 F\_KRN\_SHIFT\_BYTES\_BY1

Action	Moves bytes (by one) to the right and replaces first
	byte with bytes counter.
Entry	HL = MEMORY address of last byte to move.
	BC = number of bytes to move.
Exit	None
Destroys	A, DE, HL
Calls	None

# ${\bf 4.7.4} \quad {\bf F\_KRN\_CLEAR\_MEMAREA}$

Action	Clears (with zeros) a number of bytes, starting at a specified <b>MEMORY</b> address. Maximum 256 bytes can be cleared.
Entry	IX = MEMORY address of first byte to clear.
	B = number of bytes to clear.
Exit	None
Destroys	A, BC, IX
Calls	None

## 4.7.5 F\_KRN\_CLEAR\_DISKBUFFER

Action	Clears (with zeros) the <b>MEMORY</b> area of the <b>DISK</b>
	buffer.
Entry	None
Exit	None
Destroys	BC, IX
Calls	F_KRN_CLEAR_MEMAREA

# 4.8 Real-Time Clock Routines

# 4.8.1 F\_KRN\_RTC\_GET\_DATE

Action	Calls the BIOS function to get date from the RTC,		
	and then calculates the year in four digits.		
Entry	None		
Exit	RTC_year4		
Destroys	A, DE, HL		
Calls	None		
	F_KRN_MULTIPLY816_SLOW		

## 4.8.2 F\_KRN\_RTC\_SHOW\_TIME

Action	Sends to the <b>Serial Channel</b> A the values of hour,		
	minutes and seconds from SYSVARS, as hh:mm:ss		
Entry	None		
Exit	None		
Destroys	A, BC, DE, tmp_addr1		
Calls	F_KRN_BIN_TO_BCD4		
	F_KRN_BCD_TO_ASCII		
	F_BIOS_SERIAL_CONOUT_A		

# ${\bf 4.8.3 \quad F\_KRN\_RTC\_SHOW\_DATE}$

Action	Sends to the <b>Serial Channel A</b> the values of day, month, year (4 digits) and day of the week (3 letters) from SYSVARS, as dd/mm/yyyy www		
Entry	None		
Exit	None		
Destroys	A, BC, DE, tmp_addr1		
Calls	F_KRN_BIN_TO_BCD4		
	F_KRN_BIN_TO_BCD6		
	F_KRN_BCD_TO_ASCII		
	F_BIOS_SERIAL_CONOUT_A		

# 4.8.4 F\_KRN\_RTC\_SET\_TIME

Action	Converts ASCII values to Hexadecimal, RTC_hour,		
	RTC_minutes, RTC_seconds and calls the BIOS		
	function to change time via <b>ASMDC</b> .		
Entry	IX = MEMORY address where the new time is		
	stored in ASCII format.		
Exit	None		
Destroys	A, HL, RTC_hour, RTC_minutes, RTC_seconds		
Calls	F_KRN_ASCII_TO_HEX		
	F_KRN_BCD_TO_BIN		
	F_BIOS_RTC_SET_TIME		

## 4.8.5 F\_KRN\_RTC\_SET\_DATE

Action	Converts ASCII values to Hexadecimal, RTC_year,				
	RTC_month, RTC_day, RTC_day_of_the_week, and				
	calls the BIOS function to change date via <b>ASMDC</b> .				
Entry	IX = MEMORY address where the new date is				
	stored in ASCII format.				
Exit	None				
Destroys	A, HL, RTC_year, RTC_month, RTC_day,				
	RTC_day_of_the_week				
Calls	F_KRN_ASCII_TO_HEX				
	F_KRN_BCD_TO_BIN				
	F_BIOS_RTC_SET_DATE				

# 5 dastaZ80 File System (DZFS)

In summary, a file system is a layer of abstraction to store, retrieve and update a set of files.

A file system manages access to the data and the metadata of the files, and manages the available space of the device, dividing the storage area into units of storage and keeping a map of every storage unit of the device.

DZFS main goal is to be very simple to implement. As the free **MEMORY** (i.e. **RAM** - OS - System variables and buffers) of the dastaZ80 is about 55,952 bytes, it makes no sense to have files bigger than that, as will not fit. Therefore, DZFS defines that a Block can store only a single file.

dastaZ80 access the **DISK** via Logical Block Addressing (LBA), which is a particularly simple linear addressing schema, in which each sector is assigned a unique number rather than referring to a cylinder, head, and sector (CHS) to access the disk.

A typical LBA scheme uses a 28-bit value that allows up to 8.4 GB of data storage capacity. DZFS schema is as follows:

LBA 3	LBA 2	LBA 1	LBA 0
XXXX	XXXX XXXX	BBBB BBBB	BBSS SSSS

### Where:

- S is Sector (6 bits)
- B is Block (10 bits)
- X not used (12 bits)

### 5.1 DZFS characteristics

- Bytes per Sector: 512
- Sectors per Block: 64
- Bytes per Block: 32,768 (64 \* 512). This also defines the maximum size of a file and the BAT maximum size.
- Bytes per BAT entry: 32
- **BAT entries**: 1024 (32,768 / 32). This also defines the maximum number of files per **DISK**.
- Maximum bytes per File: 1 Block (32,768 bytes)
- Maximum bytes per DISK: 1024 Blocks (1 Block = 1 File) \* 32,768 bytes per Block = 33,554,432 bytes (33.5 MB)

## 5.2 DISK anatomy

A **DISK** is divided into areas:

- Superblock = 512 bytes (1 Sector)
- Block Allocation Table (BAT) = 1 Block (64 Sectors = 32,768 bytes)
- Data Area = 1023 Blocks (65,472 Sectors = 33,521,664 bytes)

## 5.2.1 Superblock

The first 512 bytes on the **DISK** contain fundamental information about the geometry, and is used by the OS to know how to access every other information on the **DISK**. On IBM PC-compatibles, this is known as the *Master Boot Record* or *MBR* for short. In DZFS, it is called *Superblock*, as it is an orphan sector that doesn't belong to any block.

Offset	Length (bytes)	Description	Example
0x00	2	Signature. Used to check that this is a Superblock. Set to 0xabba	AB BA
0x02	1	Not used	00
0x03	8	File system identifier. ASCII values for human-readable. Padded with spaces.	DZFSV1
0x0B	4	Volume serial number	35 2A 15 F2
0x0F	1	Not used.	00
0x10	16	Volume Label. ASCII values. Padded with spaces.	dastaZ80 Main
0x20	8 Volume Date creation. ASCII values (ddmmyyyy).		03102022
0x28	6	Volume Time creation. ASCII values (hhmmss).	142232
0x2E	2	Bytes per Sector (in Hexadecimal little-endian)	00 02
0x30	1	Sectors per Block (in Hexadecimal)	40
0x31	1	Number of Partitions	01
0x32 - 0x64	51	Copyright notice (ASCII value)	Copyright 2022David Asta The MIT License (MIT)

Offset	Length (bytes)	Description	Example
0x65 - 0x1FF	411	Not used (filled with 0x00)	00 00 00 00

# 5.2.2 Block Allocation Table (BAT)

The BAT is an area of 32 bytes on the **DISK** used to store the details about the files saved in the Data Area, and is comprised of file descriptors called *entry*. Each entry holds information about a single file.

For simplicity, each entry works also as index. The first entry describes the first file on the **DISK**, the second entry describes the second file, and so on.

Offset	Length (bytes)	Description	Example
0x00	14	Filename	46 49 4C 45 30 30 30 30 31 20 20 20 20 20
3230		Padded with spaces at the end. (only allowed A to Z and 0 to 9. No spaces allowed. Cannot start with a number.)	
		First character also indicates 00=available, 7E=deleted (will appear as ~)	
		Attributes (0=Inactive / 1=Active)	Read Only, System file, Executable = 1101 = 0D
0x0E	14	Bit 0 = Read Only Bit 1 = Hidden Bit 2 = System Bit 3 = Executable Bit 4-7 = File Type (see below)	
0x0F	2	Time created 5 bits for hour (binary number 0-23) 6 bits for minutes (binary number 0-59) 5 bits for seconds (binary number seconds / 2)	F5 9A
0x11	2	Date created 7 bits for year since 2000 (max. is year 2127)	69 1B

Offset	Length (bytes)	Description	Example
		4 bits for month (binary number 0-12)	
		5 bits for day (binary number 0-31)	
0x13	2	Time last modified (same formula as Time created)	F5 9A
0x15	2	Date last modified (same formula as Date created)	69 1B
0x17	2	File size in bytes (little-endian)	26 00
0x19	1	File size in sectors (little-endian) 01	
0x1A	2	Entry number (little-endian)	00 00
0x1C	2	1st Sector (where the file data starts) It is calculated when the file is created. The formula is: 65 + 64 * entry_number	41 00
0x1E	2	Load address (The start address little- endian where it will be loaded in RAM)	68 25

Bits 4-7	File Type	Description
0x00	USR	User defined
0x01	EXE	Executable binary
0x02	BIN	Binary (non-executable) data
0x03	BAS	BASIC code
0x04	TXT	Plain ASCII Text file
0x05		Not used
0x06		Not used
0x07		Not used
0x08		Not used
0x09		Not used
0x0A		Not used
0x0B		Not used
0x0C		Not used
0x0D		Not used
0x0E		Not used
0x0F		Not used

# 5.2.3 Data Area

The Data Area is the area of the  $\mathbf{DISK}$  used to store file data (e.g. programs, documents).

It is divided into Blocks of 64 Sectors each.

## 6 How To

#### 6.1 Read data from DISK

Given DISK\_is\_formatted is equal to 0xFF (i.e. **DISK** is formatted with DZFS file system), call F\_KRN\_DZFS\_LOAD\_FILE\_TO\_RAM with DE equal to first sector (512 bytes) to read and IX equal to how many sectors to read.

Read bytes will be copied into MEMORY, following these rules:

- if  $DISK\_loadsave\_addr <> 0$ , load bytes to this address.
- if  $DISK\_loadsave\_addr = 0$ ,
  - if  $DISK_cur_file\_load\_addr <> 0$ , load bytes to this address.
  - if  $DISK_cur_file_load_addr = 0$ , load bytes to start of Free RAM (0x4420).

### 6.2 Write data to DISK

Given DISK\_is\_formatted is equal to 0xFF (i.e. **DISK** is formatted with DZFS file system):

- Store the filename (in ASCII) somewhere in **MEMORY**.
- call F\_KRN\_DZFS\_GET\_FILE\_BATENTRY, with HL equal to the MEMORY address where the filename is stored. If a file with the specified filename does not exist, flag z will be set to indicate that it is OK to save the file.
- call F\_KRN\_DZFS\_CREATE\_NEW\_FILE, with:
  - HL equal to the address in **MEMORY** of first byte to be stored.
  - BC equal to the total number of bytes to be stored.
  - IX equal to the address in MEMORY where the filename is stored.
  - *DISK\_loadsave\_addr* equal to:
    - \* zero, will use the address in **MEMORY** of first byte as the load address when loading the file (i.e. *DISK\_loadsave\_addr*).
    - \* non zero, will use this number as the load address when loading the file (i.e. *DISK\_loadsave\_addr*).

## 6.3 Convert between HEX and DEC and ASCII

In many situations your programs will need to convert between different number notations (hexadecimal, decimal, ASCII). For example, all characters typed by the user are read by the function F\_BIOS\_SERIAL\_CONIN\_A, which stores the ASCII value of the pressed key in the A register. In order to do manipulations of data, our program will need to convert this ASCII data into either hexadecimal or decimal notation.

Take as an example the CLI command for saving files to disk (save). As shown in the dastaZ80 User's Manual section 5.3 Disk Commands, this command takes two parameters: <start\_address>, which is expressed in hexadecimal, and <number\_of\_bytes>, which is expressed in decimal. But in both cases, F\_BIOS\_SERIAL\_CONIN\_A will give us (in the A register) the ASCII representation of the numbers typed by the user.

Before we can set a pointer to the memory address specified by  $< start\_address>$ , and set our counter to  $< number\_of\_bytes>$ , we need to convert those ASCII numbers into hexadecimal and decimal respectively.

The Kernel, offers a series of functions to help the programmer with the conversions:

- F\_KRN\_ASCIIADR\_TO\_HEX: Converts ASCII 4 chars to HEX 2 bytes. (e.g. 32 35 37 30 to 0x2570)
- F\_KRN\_ASCII\_TO\_HEX: Converts ASCII 2 chars to HEX 1 byte. (e.g. 33 45 to 0x3E)
- KRN\_HEX\_TO\_ASCII: Converts HEX 1 byte to ASCII 2 chars. (e.g. 0x3E to 33 45)
- F\_KRN\_BCD\_TO\_BIN: Converts a byte of BCD to a byte of hexadecimal. (e.g. 12 is converted into 0x0C).
- F\_KRN\_BIN\_TO\_BCD4: Converts HEX 1 byte to DEC 4 digits. (e.g. 0x80 to 0128)
- F\_KRN\_BIN\_TO\_BCD6: Converts HEX 2 bytes to DEC 6 digits. (e.g. 0xfff to 065535)
- F\_KRN\_BCD\_TO\_ASCII: Converts DEC 6 digits to ASCII 6 chars. (e.g. 512 to 30 30 35 31 32)
- F\_KRN\_BIN\_TO\_ASCII: Converts HEX 2 bytes to ASCII string. (e.g. 0x7FFF to 33 32 37 36 37)
- F\_KRN\_DEC\_TO\_BIN: Converts HEX 2 bytes to ASCII string. (e.g. 33 32 37 36 37 to 0x7FFF)

# 7 Appendixes

### 7.1 ANSI Terminal colours

- ANSI\_COLR\_BLK Black
- ANSI\_COLR\_RED Red
- ANSI\_COLR\_GRN Green
- ANSI\_COLR\_YLW Yellow
- ANSI\_COLR\_BLU Blue
- ANSI\_COLR\_MGT Magenta
- ANSI\_COLR\_CYA Cyan
- ANSI\_COLR\_WHT -

### 7.2 How DZFS Volume Serial Number is calculated

Calculated by combining the date and time at the point of format:

- first byte is calculated as follows:
  - day + miliseconds (converted to hexadecimal)
  - e.g. 3 + 50 = 53 (0x35)
- second byte is calculated as follows:
  - month + seconds (converted to hexadecimal)
  - e.g. 10 + 32 = 42 (0x2A)
- $\bullet$  last two bytes are calculated as follows:
  - (hours [if pm + 12] \* 256) + minutes + year (converted to hexadecimal)
  - e.g. (2 + 12 = 14 \* 256 = 3584) + 22 + 2012 = 5618 (0x15 0xF2)

### 7.3 OS Boot Sequence

After power on or after pressing the **RESET** button:

## • Bootstrap

- Copy contents of the ROM into High RAM (0x8000 0xffff).
- Disable ROM chip and enable Low RAM (0x0000 0x7FFF). Therefore, all **MEMORY** is RAM from now on.

- Copy the copy of ROM inm High RAM to Low RAM. Bootstrap code is not copied.
- Transfer control to BIOS (jp F\_BIOS\_SERIAL\_INIT).
- Initialise SIO/2 (F\_BIOS\_SERIAL\_INIT)
  - Initialise SIO/2.
    - \* Set Channel A as 115,000 bps, 8N1, Interrupt in all received characters.
    - \* Set Channel B as 115,000 bps, 8N1, Interrupt in all received characters.
    - \* Set Interrupt Vector to 0x60.
  - Set CPU to Interrupt Mode 2.
  - jp F\_BIOS\_WBOOT
- BIOS Boot (F\_BIOS\_WBOOT)
  - Set SIO/2 Channel A as primary I/O.
  - Transfer control to Kernel (jp F\_KRN\_START).
- Kernel Boot (F\_KRN\_START)
  - Display dzOS welcome message.
  - Display dzOS release version.
  - Display Kernel version.
  - Display available RAM.
  - Initialise FDD.
  - Initialise SD Card.
    - \* Detect SD Card.
    - \* Display number of available Disk Image Files.
    - \* Display disk unit and name of each Disk Image File.
  - Initialise Real-Time Clock (RTC).
    - \* Detect RTC.
    - \* Display current date and time.
    - \* Display RTC's battery status.
    - \* Detect **NVRAM**.

- Initialise SYSVARS.
  - \* Set show deleted files with *cat* command as OFF.
  - \* Set default File Type as 0 (USR = User defined).
  - \* Set default loadsave address to 0x0000 (i.e. will save/load starting from Free RAM (0x4420)).
- Set default **DISK** as 1 (i.e. first Disk Image File in the **SD** card).
- Transfer control to Command-line Interpreter (CLI) (jp F\_CLI\_START).
- **CLI** (F\_CLI\_START)
  - Display CLI version.
  - Clear command buffers
  - Display prompt (>).
  - Read command entered by user.
  - Parse command.
  - Execute corresponding subroutine.
  - Loop back to Display prompt.

## 7.4 dzOS Programming Style

When writing dzOS and software for dzOS, the following style has been followed:

- All CPU registers are witten in uppercase (e.g. A, BC, DE, HL).
- All CPU flags are witten in lowercase (e.g. z, nz, c, nc, m, p).
- All assembly mnemonics are written in lowercase (e.g.  $ld\ A, \theta$ ).
- Labels for subroutines that will be public (i.e. called via a Jumpblock) are written in uppercase.
- Public subroutines contain comments specifying:
  - Short description.
  - Input CPU registers or variables (SYSVARS).
  - Output CPU registers or variables (SYSVARS).
- All hexadecimal values are written with a dollar sign as prefix.
- Tabs are written as 4 spaces.

- Mnemonics start after 2 tabs (8 spaces).
- When possible, comments are written in column 41. Otherwise in next closest tab.
- Source code is heavily commented. Mostly on each line.
- ullet The Telemark Assembler (TASM) specific:
  - $-\ .BYTE$  is used instead of .DB
  - . WORD is used instead of .DW
